Toxicity

These slight changes occur due to variations in the scrap (raw material) mix in the melting process of steel.

Volume

Volume has decreased by 1,735,000 lbs in 2016, as compared to 2015, K-061 flue dust is generated through the normal production process of steel in electric arc furnaces and controlled solely by production demands of steel facilities products.

No efforts were undertaken to reduce the volume of toxicity as there is no technology currently known to achieve this; however, recycling the material has been chosen as the most environmentally sound method available to Arkansas Steel Associates, L.L.C.
